The var gene and the corresponding P. falciparum erythrocyte membrane protein 1 (PFEMP1) modulate adhesion of parasitized red blood cell (PRBC) to CSA. The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the buffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see AMT72889 and AAMT72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of plasmodium infected erythrocytes. SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    07-JUN-1995;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          07-JUN-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents E31a of Plasmodium. E31a belongs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the buffy and start after some soluble proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Local Local 150;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sialic acid receptors on erythrocytes. The ebl-1 polypeptides may be d to vaccinate against malaria, especially caused by P. falciparum. unization with the polypeptide provides effective protection against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2000-194198/17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В
                                                                                                                                                                                                                                   Erythrocyte binding ligand (EBL) family genes were cloned from P. falciparum chromosome 7 subsegment libraries constructed during genetic studies of the chloroquine resistance locus. The 4 genes, EBL-e1 (AAQ83526), E31a (AAQ83527), EBL-e2 (AAQ83528) and Proj3 (AAQ83529), encode the proteins given in AAR70233-36, respectively. The binding domains of such proteins can be expressed e.g. in E. coli, yeast, mammalian, insect, and in vaccinia virus and denovirus-infected cells, and provide protection against P. falciparum.

                   This sequence represents Proj3 of Plasmodium. Proj3 belongs to CC the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein CC (SABP) conserved regions (see AAT72889 and AAT72888 respectively). The CC Plasmodium infected erythrocytes. SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture culture supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte supernatant. The sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DaBP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a conservative immune response in a mammal to placed in the correction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g

The invention relates to ebl-1 polypeptides that are encoded by the DBI (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the

Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium vivax and Plasmodium falciparum Duffy and sialic acid receptors on erythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against malaria. The present sequence represents the Proj3 binding domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC the Duffy inding like (DBL) family of genes which have homology to the CD Duffy antigen binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see AAT/288) and AAT/2888 respectively). The CC var family of genes modulate cytoadherence and antigenic variation of CC Plasmodium infected erythrocytes. SABP and the Duffy antigen binding CC protein (DABP) are soluble proteins that appear in the culture CC supernatant after infected erythrocytes release merozoites. DABP and CC SABP mediate the binding of merozoites and schizonts to the erythrocyte confidence. These proteins are necessary for erythrocyte invasion by the CC surface. These proteins are necessary for erythrocyte invasion by the CC invention. The compositions are for the treatment and prevention of the var-1, var-2, var-3 or var-7 genes of the DBL gene family a family of genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. CC protective immune response in a mammal to passondium merozoites and control tes cannot in the preparation of vaccines for inducing a protective immune response in a mammal to passondium merozoites.

The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the culture supernatant after crythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium vivax and Plasmodium falciparum Duffy and Sialic acid receptors on crythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against malaria. The present sequence represents the var-7 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a P. falciparum FCR3.varCSA protein, that is capable of binding to chondroitin sulfate A (CSA). The var gene and the corresponding P. falciparum erythrocyte membrane protein 1 (PERMP1) modulate adhesion of parasitized red blood cell (PRBC) to CSA. The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria. The

                                                                                                                                                                                                                                               The invention relates to a P. falciparum FCR3.varCSA protein, that is capable of binding to chondroitin sulfate A (CSA). The var gene and the corresponding P.falciparum erythrocyte membrane protein 1 (PFRMP1) modulate adhesion of parasitized red blood cell (PRBC) to CSA. The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient affilicted with maternal malaria. The present sequence represents a P. falciparum varCSA polypeptide
                                                                                                                                                                                                                     Sequence

The present sequence represents a P. falciparum varCSA polypeptide ItG2-CS2 DBL2.
                                                                                                                                                                                                                                                                                                                                                                                                                                       capable of binding to chondroitin sulfate A (CSA). The var gene and the corresponding P.falciparum erythrocyte membrane protein 1 (PFEMP1) modulate adhesion of parasitized red blood cell (PRBC) to CSA. The

                                                                                                                                                                                                                     maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria. The present sequence represents a P. falciparum varCSA polypeptide FCR3 var3DBL-gamma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Scherf A,
Gysin J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FCR3.varCSA protein; chondroitin sulfate A; erythrocyte membrane protein 1; parasitized malaria; protozoacide; FCR3 var3DBL-gamma.
                                                                                                                                                                                                                                                                                 The invention relates to a P. falciparum FCR3.varCSA protein, that is capable of binding to chondrolitin sulfate A (CSA). The var gene and the corresponding P.falciparum erythrocyte membrane protein 1 (PFEMP1) modulate adhesion of parasitized red blood cell (PREC) to CSA. The protein and the encoding gene are useful for treating and preventing

The polypeptides can inhibit, block or reverse the sequestration of erythrocytes in patients suffering from malaria. Nucleic acids derived from the PfEMPI gene can be used as probes and primers to identify a Plasmodium falciparum parasite, the primers used to generate characteristic amplification patterns from different P. falciparum strains. Antibodies specifically immunoreactive with the PfEMPI polypeptide or its fragments may be used in diagnosis of malaria infection. This is the PfEMPI protein of the MC type of Plasmodium falciparum. An alternative, truncated pfEMPI protein is given in AAW00385.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
